

myP Release Notes 1.4.4

2020-03-10

New Features

The kinematics module was extended to support pose configurations. New buttons in the pose editor now allow for the user to switch between (up to 8) possible sets of joint angles that represent the same Euclidean Coordinates of the end tool.

The names of applications can now be translated into all supported interface languages. This is done by adding labels to applications (in the application settings).

New functions allow for an application running in the background to monitor the status of myP and to react on status changes.

Similar to the already available TCP socket, you may now create and use UDP sockets in myP applications.

In addition to logging messages via myP applications to log files, these messages now show directly in a new Application Log tab at the bottom of the graphical user interface.

Improvements

Improving the robustness of system start-up (loading add-ons and calibrating the robot) and internal thread handling.

Improving the overall stability of the Voice Module. And adding support for two more voices to choose from.

Fixing a few issues with executing paths and gripper movements.

Adding a sequence identifier to TCP messages to be able to identify received messages.

Continuous Integration

Continuing to add new features for developing skills for our mobile robot Lio, including minor graphical improvements in Lio's user interfaces.

Third-Party Changes

Recent changes in third-party modules affect all myP versions including myP 1.4.4:

If you are using the myP GUI via Microsoft Edge, we advise for you to upgrade your browser to the new "Chromium based Edge" version. Tests showed that all known myP GUI issues in Edge have been resolved in Chromium Edge.

Due to a recent change in the browser built-in voice module ResponsiveVoice, unfortunately the "say"-function only works anymore if you are using the Google Chrome browser and the languages English or German. You may want to consider upgrading to our new Voice Module (available since myP 1.4.0) in which we support many more languages and accents, reacting to spoken text, supporting connected USB speakers and microphones, and more.
